1 Introduction and functional overview

The CanTSyn module handles the distribution of time information over CAN buses.

Just transmitting the time information from the master to the slaves in a broadcast CAN message has the disadvantage that the time value becomes inaccurate due to CAN specific effects like arbitration and BSW specific delays.

The concept proposes a two-step mechanism:

- In a first broadcast message (the so-called SYNC message), the second portion of the time information (t0r) is transmitted. The transmitting ECU, i.e. the Time Master, uses CAN low-level mechanisms like the "CAN transmit confirmation" to detect the point in time (t1r) when the message was actually transmitted, i.e. it takes a timestamp.
 - A receiving ECU, i.e. the Time Slave, receives the message and uses CAN low-level mechanisms like the "CAN receive indication" to detect the point in time (t2r) when the message was actually received.
- In a second broadcast message (the so-called Follow-Up (FUP) message), the Time Master transmits the offset between the time information transmitted in the previous SYNC message and the actual detected transmission time. No timestamp is taken for the FUP message, neither on the transmitting nor on the receiving side.
- The Time Slave can now combine the information within the SYNC and within the FUP message and with its previously taken timestamp for the received SYNC message and determine the transmitted time information in a more precise way by just receiving one message and omitting timestamps.

The following Figure shows the CAN Time Synchronization mechanism.

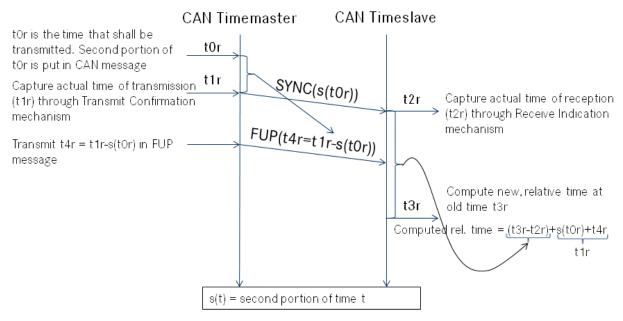

Figure 1: CAN Time Synchronization mechanism

2 Acronyms, Abbreviations and Definitions

This section lists module local Abbreviations and Definitions. For a complete set of Synchronized Time Base related Abbreviations and Definitions refer to the corresponding chapter in [4].

Abbreviation /	Description
Acronym:	
(G)TD	(Global) Time Domain
(G)TM	(Global)Time Master
<bus>TSyn</bus>	A bus specific Time Synchronization module
CAN	Controller Area Network
CanTSyn	Time Synchronization module for CAN
CRC	Cyclic Redundancy Checksum
Debounce Time	Minimum gap between two Tx messages with the same PDU
DEM	Diagnostic Event Manager
DET	Default Error Tracer
DLC	Data Length Code
FUP message	Follow-Up message
OFNS message	Offset adjustment message
OFS message	Offset Synchronization message
StbM	Synchronized Time-Base Manager
SYNC message	Time Synchronization message
TG	Time Gateway
Timesync	Time Synchronization
TS	Time Slave
TSD	Time Sub-domain

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software (SWS BSW General [3]) which is also valid for CanTSyn.

Thus, the General Specification on Basic Software (SWS BSW General) shall be considered additionally and as required specification for CanTSyn.

4 Constraints and assumptions

4.1 Limitations

- The current version of CanTSyn does not support hardware timestamping capabilities.
 - The first consequence is that the Time Synchronization is less accurate due to Rx-/Tx-ISR latencies and execution time until the Virtual Local Time is retrieved.
 - The second consequence is the need of not nested interrupts in the CAN driver for the Global Time PDUs (i.e., it is strongly recommended not to invoke the TX confirmation and RX indication functions in polling mode).
- The Time Base in the SYNC and OFS messages is limited to 32 bit, wherefore the maximum supported time value is 4294967295 seconds (2³²-1).
- Time Masters, Time Gateways and Time Slaves shall work with a Time Base reference clock with a worst-case accuracy of 2µs.
- "CRC secured" in the context of this document refers to CRC integrity protection mechanism and does not imply that CRC is used as a cybersecurity solution.

4.2 Applicability to car domains

Automotive systems requiring a common Time Base for ECUs regardless of which bus system the ECUs are connected to.

5 Dependencies to other modules

The Time Synchronization over CAN (CanTSyn) has interfaces towards the Synchronized Time-Base Manager (StbM), the CAN Interface (CanIf), the Basic Software Mode Manager (BswM) and the Default Error Tracer (DET).

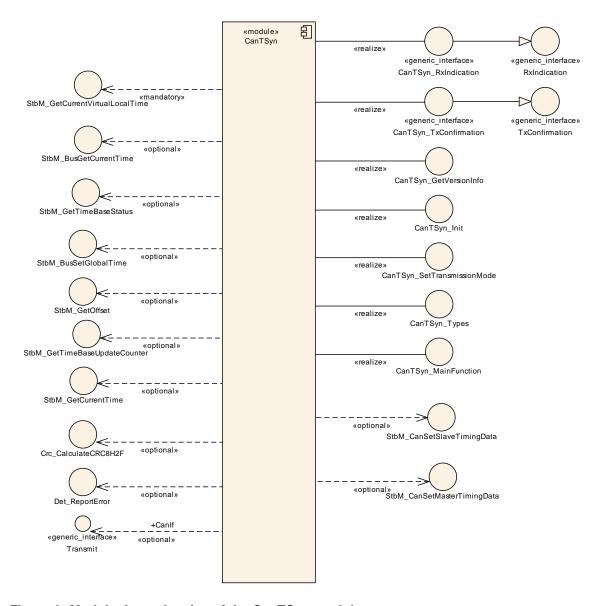

Figure 2: Module dependencies of the CanTSyn module

7 Functional specification

This chapter defines the behavior of the Time Synchronization over CAN. The API of the module is defined in chapter 8, while the configuration is defined in chapter 10.

7.1 Overview

The Time Synchronization over CAN is responsible to realize the CAN specific Time Synchronization protocol.

Time Synchronization principles and common wording is described in [4].

7.2 Module Handling

This section contains description of auxiliary functionality of the Time Synchronization over CAN.

[SWS_CanTSyn_00135][

If CanTSyn calls an API of the StbM, it shall use the Time Base ID of the Time Base referenced via the parameter <code>CanTSynSynchronizedTimeBaseRef</code> of the corresponding Time Domain.

(RS_TS_20032, RS_TS_20038)

7.2.1 Interrupt Handling

When transmitting or receiving a SYNC message, the current value of the Virtual Local Time needs to be captured in the Rx Indication / Tx Confirmation callbacks

- either in interrupt mode in context of the Rx / Tx interrupt
- or in polling mode in the main function (Note: it is strongly recommended not to use polling mode for GTS).

Any delay between the occurrence of the interrupt itself and the determination of the current Virtual Local Time worsens the precision of either the transmitted or received Time Base.

Therefore, it is inevitable that these Rx Indication / Tx Confirmation callbacks establish a protection against interruptions immediately after being called (if called in context of the Rx / Tx interrupt with interrupt nesting disabled, this is implicitly ensured by the controller).

Thereafter only the necessary checks shall be made to determine that the message is a SYNC message (and to determine the Time Base ID if necessary). Once the Time Base ID and the SYNC message type are confirmed the current value of the Virtual Local Time is obtained from a function call to the StbM (still in the context of locked interrupts). Afterwards the interruption protection can be removed without having a negative impact on the precision.

As a consequence it might be possible that a snapshot of the Virtual Local Time is taken although the subsequent frame checks (e.g., CRC validation, SC validation) might fail and thus the snapshot becomes superfluous.

7.2.2 Initialization

The Time Synchronization over CAN is initialized via <code>CanTSyn_Init()</code>. Except for <code>CanTSyn_GetVersionInfo()</code> and <code>CanTSyn_Init()</code>, the API functions of the Time Synchronization over CAN may only be called when the module has been properly initialized.

[SWS_CanTSyn_00003][

A call to CantSyn_Init() initializes all internal variables and sets the Time Synchronization over CAN to the initialized state. I(RS_TS_00003, RS_TS_00004)

[SWS_CanTSyn_00006][

When CantSyn_Init() is called in initialized state, the Time Synchronization over CAN shall re-initialize its internal variables. I(RS TS 00003, RS TS 00004)

[SWS_CanTSyn_00007][

The Sequence Counter (*SC*) shall be initialized with 0. |(RS_TS_20033)

7.2.3 Error Handling

[SWS CanTSyn 00088][

On errors and exceptions, the CanTSyn module shall not modify its current module state but shall simply report the error event. I(RS TS 20034, SRS BSW 00323)

7.3 Message Format

SYNC, FUP, OFS and OFNS messages are assigned to a dedicated message type "TimeSync".

SYNC, FUP, OFS and OFNS messages of the same Time Domain share the same CAN ID by using a multiplexed signal group. For different Time Domains the same CAN ID may be used if Timesync messages are sent by the same Time Master or Time Gateway. For different Time Domains different CAN IDs shall be used if Timesync messages are sent by different Time Masters or Time Gateways. The multiplexer is located at Byte 0, named as "*Type*".

The usage of a *CRC* is optional. To ensure a great variability between several time observing units, the configuration decides of how to handle *CRC* secured Timesync

messages if the receiver does not support the *CRC* calculation. Hence it might be possible, that a receiver is just using the given Time Base value without evaluating the *CRC*.

[SWS_CanTSyn_00008][

The byte order for time value signals in Time Synchronization messages is "Big Endian".

J(RS_TS_20035)

[SWS_CanTSyn_00010][

The DLC of SYNC, FUP, OFS and OFNS messages is 8 for classic CAN.

The DLC of SYNC, FUP, OFS and OFNS messages is 16 for CAN FD if CantSynUseExtendedMsgFormat is TRUE.

I(RS_TS_20035, RS_TS_20068)

[SWS CanTSyn 00011][

Depending on its type Time Synchronization messages may contain User Data according to the given message format.

(RS_TS_20035, RS_TS_20037)

[SWS_CanTSyn_00012][

User Data shall be read consistently from incoming Time Synchronization messages that contain User Data Fields.

(RS_TS_20037)

[SWS CanTSvn 00013][

User Data shall be written consistently to outgoing Time Synchronization messages that contain User Data Fields.

If the number of User Data Fields in a Time Synchronization message is greater than the number of User Data Bytes provided by the StbM, the remaining User Data Fields shall be set to 0 (default value).

(RS_TS_20037)

[SWS CanTSyn 00014][

User Data shall be mapped to the StbM_UserDataType, whereas the byte number given in the message and by the StbM_UserDataType shall match (User Byte 0 mapped to StbM_UserDataType.userByte0 etc.).

StbM_UserDataType.userDataLength shall be set to the Time Synchronization message type specific number of User Bytes.

(RS_TS_20037)

7.3.1 SYNC and FUP Message

[SWS_CanTSyn_00015][

SYNC not CRC secured message format:

Byte 0: Type = 0x10

Byte 1: User Byte 1, default: 0

Byte 2: D = Time Domain 0 to 15 (Bit 7 to Bit 4)

SC = Sequence Counter (Bit 3 to Bit 0)

Byte 3: User Byte 0, default: 0

Byte 4-7: SyncTimeSec = 32 bit LSB of the 48 bits seconds part of the time

If CanTSynUseExtendedMsqFormat = TRUE:

Byte 8-15: reserved, always 0

I(RS_TS_20033, RS_TS_20035, RS_TS_20068)

[SWS_CanTSyn_00016][

FUP not CRC secured message format:

Byte 0: Type = 0x18

Byte 1: User Byte 2, default: 0

Byte 2: D = Time Domain 0 to 15 (Bit 7 to Bit 4)

SC = Sequence Counter (Bit 3 to Bit 0)

Byte 3: reserved (Bit 7 to Bit 3), default: 0

SGW (Bit 2)

SyncToGTM = 0

SyncToSubDomain = 1

OVS = Overflow of seconds (Bit 1 to Bit 0)

Byte 4-7: SyncTimeNSec = 32 Bit time value in nanoseconds

If CanTSynUseExtendedMsgFormat = TRUE:

Byte 8-15: reserved, always 0

I(RS_TS_20033, RS_TS_20035, RS_TS_20068)

[SWS_CanTSyn_00017][

SYNC CRC secured message format:

Byte 0: Type = 0x20

Byte 1: CRC

Byte 2: D = Time Domain 0 to 15 (Bit 7 to Bit 4)

SC = Sequence Counter (Bit 3 to Bit 0)

Byte 3: User Byte 0, default: 0

Byte 4-7: SyncTimeSec = 32 bit LSB of the 48 bits seconds part of the time

If CanTSynUseExtendedMsgFormat = TRUE:

Byte 8-15: reserved, always 0

I(RS_TS_20033, RS_TS_20035, RS_TS_20068)

[SWS_CanTSyn_00018][

FUP CRC secured message format:

Byte 0: Type = 0x28

Byte 1: CRC

Byte 8-15: reserved, always 0

I(RS_TS_20033, RS_TS_20035, RS_TS_20068)

7.3.2 Offset Messages

Offset messages can be multiplexed with the Time Synchronization messages (using the same PDU, etc.).

For Classic CAN (CAN 2.0) two different Offset messages are used, OFS and OFNS. For both of them there are variants with and without a CRC field.

For CAN FD, if CantSynUseExtendedMsgFormat is TRUE, the content of OFS and OFNS is merged into a single Extended OFS message (variants with and without a CRC field exist as well).

[SWS_CanTSyn_00132][

CantSynUseExtendedMsgFormat shall always be FALSE for CAN 2.0 buses. |(RS_TS_20068)

[SWS_CanTSyn_00130][

If CantSynUseExtendedMsgFormat is FALSE, then the Normal Offset Message Format shall be used as specified in section 7.3.2.1. I(RS_TS_20068)

[SWS_CanTSyn_00131][

If CantSynUseExtendedMsgFormat is TRUE, then the Extended Offset Message Format shall be used as specified in section 7.3.2.2. |(RS_TS_20068)

I(RS_TS_20033, RS_TS_20036, RS_TS_20068)

7.4 Acting as Time Master

A Time Master is an entity which is the master for a certain Time Base and which propagates this Time Base to a set of Time Slaves within a certain segment of a communication network, being a source for this Time Base.

If a Time Master is also the owner of the Global Time Base, the Time Base from which all further Time Bases are derived from, then it is the Global Time Master. A Time Gateway typically consists of one Time Master port which is connected to one or more Time Slaves. When mapping time entities to real ECUs it has to be noted, that an ECU could be Time Master (or even Global Time Master) for one Time Base and Time Slave for another Time Base.

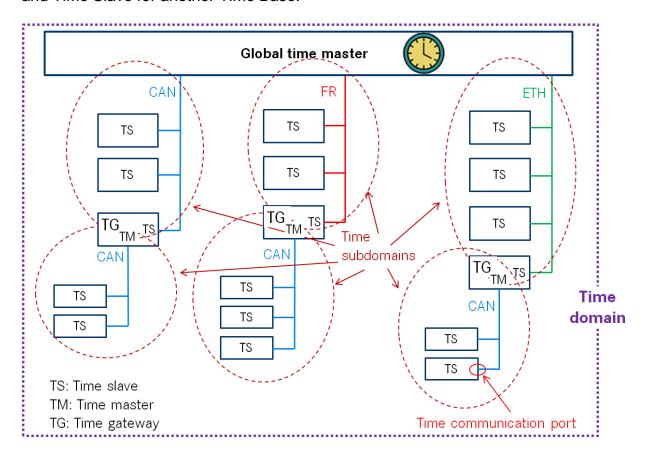

Figure 3: Terminology Example

[SWS_CanTSyn_00136][

A master shall transmit SYNC, FUP, OFS and OFNS messages by calling CanIf_Transmit with the Pduld derived via CanTSynGlobalTimePduRef of the corresponding Time Domain. I(RS TS 20031)

7.4.1 SYNC and FUP message processing

[SWS_CanTSyn_00025][

A Time Master shall start each Time Synchronization sequence for a Synchronized Time Base with a SYNC message. I(RS TS 20031, RS TS 20035)

[SWS_CanTSyn_00026][

A Time Master shall finish each Time Synchronization sequence for a Synchronized Time Base with a FUP message. I(RS_TS_20031, RS_TS_20035)

[SWS_CanTSyn_00027][

If a transmission of a SYNC or FUP message fails (CanTSyn_TxConfirmation() is called with E_NOT_OK), CanTSyn shall reset the state machine to start with a new SYNC transmission again once it is due. [(RS_TS_20034, RS_TS_20035)]

Note: No FUP message will be sent, if the SYNC message transmission fails.

[SWS_CanTSyn_00028][

If configured as Time Master of a Synchronized Time Domain (refer to CantSynGlobalTimeDomain) the CantSyn module shall periodically transmit SYNC messages (according to Figure 4) with the cycle CantSynGlobalTimeTxPeriod (ECUC_CantSyn_00017:) if

- the GLOBAL TIME BASE bit within the timeBaseStatus is set
- and CantSynGlobalTimeTxPeriod is unequal to 0
- and if the associated cyclicMsgResumeCounter is not running (see 7.4.5).

The cyclic transmission shall be started in the earliest possible CanTSyn_MainFunction() call once the requirements above are fulfilled. J(RS_TS_20031, RS_TS_20035)

Note: "earliest possible" means:

- In the next CantSyn_MainFunction(), because GLOBAL_TIME_BASE is set outside the CantSyn MainFunction().
- In the current CantSyn_MainFunction(), when switching from immediate to cyclic transmission (because this decision is made inside the CantSyn MainFunction()).

[SWS CanTSvn 00029][

The SYNC and FUP sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization

messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages.

J(RS_TS_20035)

[SWS_CanTSyn_00031][

Depending on CantSynGlobalTimeTxCrcSecured (ECUC_CantSyn_00015:) the SYNC / FUP message shall be of type:

CanTSynGlobalTimeTxCrcSecured	SYNC	FUP
CRC_NOT_SUPPORTED	0x10	0x18
	SYNC not CRC	FUP not CRC
	secured message	secured message
CRC SUPPORTED	0x20	0x28
_	SYNC CRC	FUP CRC secured
	secured message	message

I(RS_TS_20033, RS_TS_20035)

[SWS_CanTSyn_00032][

A transmitter of FUP messages (Time Master) is using as trigger condition for SYNC to FUP that the <code>debounceCounter</code> value reaches 0 as described in 7.4.4. <code>J(RS_TS_20031, RS_TS_20035)</code>

[SWS_CanTSyn_00033][

Each transmission request of a SYNC message shall be monitored for a transmit confirmation timeout.

If ${\tt CanTSyn_TxConfirmation}$ () is not called within 3 sec after transmission request, CanTSyn shall

- wait until CanTSyn_TxConfirmation() is called (with E_OK or E_NOT_OK) and
- send no FUP message and
- instead reset the state machine to start with a new SYNC transmission once it is due.

I(RS_TS_20034, RS_TS_20035)

Note: A timeout of 3 sec is used to avoid an overflow of the SyncTimenSec value in the FUP message (value range: 0 .. 2^{32} - 1 ns), if $CanTSyn_TxConfirmation$ () is called late

7.4.2 OFS message processing

[SWS_CanTSyn_00035][

A Time Master shall start each Time Synchronization sequence for an Offset Time Base with an OFS message.

I(RS TS 20031, RS TS 20036)

[SWS_CanTSyn_00036][

If CantSynUseExtendedMsgFormat is FALSE, a Time Master shall finish each Time Synchronization sequence for an Offset Time Base with an OFNS message. |(RS_TS_20031, RS_TS_20036, RS_TS_20068)

Note: If CantsynUseExtendedMsgFormat is TRUE, OFNS messages are not required.

[SWS_CanTSyn_00037][

If the transmission of an OFS or an OFNS message fails (i.e.,

CanTSyn_TxConfirmation() for the corresponding PDU is called with parameter result set to E_NOT_OK), the state machine shall be reset to start with a new OFS transmission again (once it is due).

I(RS_TS_20034, RS_TS_20036)

Note: No OFNS message will be sent, if the OFS message transmission fails

[SWS_CanTSyn_00038][

If configured as Time Master of an Offset Time Domain (refer to CanTSynGlobalTimeDomain) the CanTSyn module shall periodically transmit OFS messages with the cycle CanTSynGlobalTimeTxPeriod (ECUC_CanTSyn_00017:) if

- the GLOBAL_TIME_BASE bit within the timeBaseStatus of the referenced Time Base CantSynSynchronizedTimeBaseRef (refer ECUC_CantSyn_00022:) is set
- and CanTSynGlobalTimeTxPeriod is unequal to 0
- and if the associated cyclicMsgResumeCounter is not running (see 7.4.5).

The cyclic transmission shall be started in the earliest possible CanTSyn_MainFunction() call once the requirements above are fulfilled. J(RS_TS_20031, RS_TS_20036)

Note: "earliest possible" means:

- In the next CantSyn_MainFunction(), because GLOBAL_TIME_BASE is set outside the CantSyn MainFunction().
- In the current CanTSyn_MainFunction(), when switching from immediate to cyclic transmission (because this decision is made inside the CanTSyn MainFunction()).

[SWS CanTSyn 00039][

The OFS and OFNS sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages. [(RS_TS_20036)]

[SWS CanTSvn 00040][

A transmitter of OFNS messages (Time Master) is using as trigger condition for OFS to OFNS that the debounceCounter value reaches 0 as described in 7.4.4. I(RS_TS_20036)

[SWS_CanTSyn_00041][

Depending on CanTSynGlobalTimeTxCrcSecured (ECUC_CanTSyn_00015:) the OFS / OFNS message shall be of type:

	CanTSynGlobalTime	OFS	OFNS
	TxCrcSecured		
CAN	CRC_NOT_SUPPORTED	0x34	0x3C
		OFS not CRC	OFNS not CRC
		secured message	secured message
	CRC_SUPPORTED	0x44	0x4C
	_	OFS CRC secured	OFNS CRC secured
		message	message
CAN FD	CRC_NOT_SUPPORTED	0x54	Not available
(CanTSyn		OFS not CRC	
UseExten		secured message	
dedMsgFo	CRC_SUPPORTED	0x64	
rmat =	_	OFS CRC secured	
TRUE)		message	

I(RS_TS_20033, RS_TS_20036, RS_TS_20068)

[SWS_CanTSyn_00042][

Each transmission request of an OFS message shall be monitored for a transmit confirmation timeout.

If ${\tt CanTSyn_TxConfirmation}$ () is not called within 3 sec after transmission request, CanTSyn shall

- wait until CantSyn_TxConfirmation() is called (with E_OK or E_NOT_OK) and
- send no OFNS message and
- instead reset the state machine to start with a new OFS transmission once it is due.

I(RS TS 20034, RS TS 20036)

Note: A reset of the state machine in the event of a timeout avoids, that a possibly outdated Offset Time is sent. Instead the latest Offset Time via StbM_GetOffset() is retrieved.

7.4.3 Transmission mode

[SWS_CanTSyn_00043][

If CantSyn_SetTransmissionMode (Controller, Mode) is called and parameter Mode equals CANTSYN_TX_OFF, all transmit request from CanTSyn shall be omitted on this CAN channel.

I(RS_TS_20031, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00044][

If CantSyn_SetTransmissionMode (Controller, Mode) is called and parameter Mode equals CANTSYN_TX_ON, all transmit request from CantSyn on this CAN channel shall be able to be transmitted.

J(RS_TS_20031, RS_TS_20035, RS_TS_20036)

7.4.4 Debounce Time

The debounce time shall inhibit transmission bursts of a specific CAN PDU. Inhibiting transmission bursts of Timesync messages on a specific CAN bus is not possible if multiple PDUs are used for multiple Time Domains since there is no inter-PDU debounce time configurable within the CanTSyn module.

[SWS_CanTSyn_00123][

If CantSynGlobalTimeDebounceTime (ECUC_CantSyn_00045:) is greater than 0 for a Time Base, CantSyn shall always do debouncing for the corresponding Timesync PDUs as described below, otherwise CantSyn shall not do any debouncing.

J(RS_TS_20031)

[SWS_CanTSyn_00124][

CanTSynGlobalTimeDebounceTime (ECUC_CanTSyn_00045:) represents the debounce value of a PDU specific debounceCounter that shall be started after the Timesync PDU has been successfully sent (i.e., CanTSyn_TxConfirmation() for the corresponding PDU is called with parameter result set to E_OK).

CanTSyn shall decrement the <code>debounceCounter</code> value on each invocation of <code>CanTSyn_MainFunction()</code>, if no Timesync PDU is transmitted. <code>I(RS_TS_20031)</code>

[SWS_CanTSyn_00125][

A new Timesync PDU shall only be sent if the corresponding debounceCounter has a value equal or less than 0. [(RS_TS_20031)

Note: Since the decrement of the <code>debounceCounter</code> takes place in the <code>CanTSyn_MainFunction()</code> call but the start of the counter takes place when the Timesync PDU has been sent (either in the subsequent <code>CanTSyn_MainFunction()</code> call or in the transmit confirmation callback function) the effective debounce time will be equal or larger than <code>CanTSynGlobalTimeDebounceTime</code>. The extension of the debounce time shall be limited to the value of <code>CanTSynMainFunctionPeriod</code>.

7.4.5 Immediate Time Synchronization

In addition to the cyclic Timesync message transmission, an immediate message transmission might be required.

Depending on configuration, the CanTSyn module checks on each CanTSyn_MainFunction() call the necessity for a Timesync message transmission for each Time Base, where a Master Port belongs to.

[SWS_CanTSyn_00117][

If CantSynImmediateTimeSync (ECUC_CantSyn_00043:) is set to TRUE for a Time Base, CantSyn shall check on each CantSyn_MainFunction() call by calling StbM_GetTimeBaseUpdateCounter(), if the timeBaseUpdateCounter of the corresponding Time Base has changed. |(RS_TS_20031)

[SWS_CanTSyn_00118][

- CanTSynImmediateTimeSync (ECUC_CanTSyn_00043:) is set to TRUE and
- the timeBaseUpdateCounter of a Time Base has changed and
- the GLOBAL TIME BASE bit of the timeBaseStatus is set and
- the debounceCounter (refer to 7.4.4) is 0 and
- no transmission of the corresponding PDU is pending (CanTSyn_TxConfirmation() has been called with E_OK or E_NOT_OK),

CanTSyn shall trigger an immediate transmission of Time Synchronization messages for the corresponding Time Base. I(RS_TS_20031)

Note: timeBaseStatus can be obtained by StbM_GetTimeBaseStatus(), StbM_BusGetCurrentTime() or StbM_GetCurrentTime().

[SWS CanTSyn 00119][

If CantSynImmediateTimeSync (ECUC_CantSyn_00043:) is set to TRUE, cyclicMsgResumeCounter and CantSynCyclicMsgResumeTime (ECUC_CantSyn_00044:) shall be considered.

J(RS_TS_20031)

[SWS_CanTSyn_00120][

CanTSynCyclicMsgResumeTime (ECUC_CanTSyn_00044:) represents the timeout value of a cyclicMsgResumeCounter that shall be started after an immediate transmission of a SYNC or an OFS message has been successfully completed (i.e., CanTSyn_TxConfirmation() for the corresponding PDU is called with parameter result set to E_OK), asynchronously to the cyclic Timesync message transmission.

cyclicMsgResumeCounter shall be decremented on each invocation of CanTSyn_MainFunction(), if no Timesync PDU is transmitted asynchronously. J(RS_TS_20031)

[SWS_CanTSyn_00121][

If the <code>cyclicMsgResumeCounter</code> has reached a value equal or less than zero, CanTSyn shall resume cyclic Timesync message transmission by sending either a SYNC or OFS message.

(RS_TS_20031)

[SWS_CanTSyn_00122][

If the cyclicMsgResumeCounter is started CanTSyn shall stop cyclic Timesync message transmission.

I(RS_TS_20031)

7.4.6 Calculation and Assembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be calculated (1st step) and how the message will be assembled (2nd step).

7.4.6.1 Global Time Calculation

[SWS_CanTSyn_00045][

The transmitter of a Synchronized Time Base (Time Master) shall perform the following steps to distribute the Synchronized Time Base exactly (refer to 9.1):

- 1. On transmission of SYNC message
 - a. Get current Synchronized Time Base's Time Tuple as [T0_{SYNC};T0_{VLT}] via StbM_BusGetCurrentTime() and write second portion of T0_{SYNC} to SyncTimeSec
- 2. On SYNC message TX confirmation
 - a. Immediately establish a protection against interruptions and run the next step:
 - b. Retrieve current Virtual Local Time value as T1_{VLT} via StbM GetCurrentVirtualLocalTime()
 - c. The protection against interruptions may be released
 - d. Calculate T4 for FUP message as T4 = $T0_{SYNCns}$ + ($T1_{VLT}$ $T0_{VLT}$) with $T0_{SYNCns}$ as nanosecond portion of $T0_{SYNC}$
- 3. On transmission of FUP message
 - a. Write second portion of T4 (T4 >= 1s) to OVS
 - b. Write nanosecond portion of T4 to SyncTimeNSec

(RS_TS_20035)

With these steps, the Synchronized Time Base value at the transmitter side has been calculated (T0_{SYNC} + T4).

Note:

When using interrupt mode with interrupt nesting disabled, the CanTSyn does not need to explicitly establish a protection against interruptions in the Tx confirmation callback. This is typically done implicitly by the controller.

[SWS_CanTSyn_00046][

The transmitter of an Offset Time Base (Time Master) shall perform the following steps to distribute the Offset Time Base exactly:

- 1. Retrieve current Offset Time via StbM GetOffset()
- 2. Write second portion of the Offset Time to OfsTimeSec
- 3. Write nanosecond portion of the Offset Time to *OfsTimeNSec* I(RS TS 20036)

Note: OFS and OFNS messages shall not be time stamped.

7.4.6.2 OVS Calculation

[SWS_CanTSyn_00047][

OVS shall be set within FUP messages if the transmitter detects a nanosecond overflow greater than the defined range of StbM_TimeStampType.nanoseconds [SWS_CanTSyn_00045] whereas the left over part of seconds which does not fit into StbM_TimeStampType.nanoseconds shall be written to OVS. I(RS TS 20035)

7.4.6.3 SGW Calculation

[SWS_CanTSyn_00030][

The SGW value (Time Gateway synchronization status) shall be retrieved from the Time Base synchronization status. If the STBM_SYNC_TO_GATEWAY bit within timeBaseStatus is not set the SGW value shall be SyncToGTM. Otherwise the SGW value shall be set to SyncToSubDomain. I(RS TS 20035, RS TS 20036)

7.4.6.4 Sequence Counter Calculation

[SWS CanTSyn 00048][

A Sequence Counter (*SC*) of 4 bit is representing numbers from 0 to 15 per Time Domain. The Sequence Counter shall be independent between SYNC and OFS messages and shall be incremented by 1 continuously on every transmission request of a SYNC or OFS message. It shall wrap around at 15 to 0 again. I(RS_TS_20033, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00049][

The Sequence Counter (SC) value for a FUP message shall be set to the SC value of the corresponding SYNC message. The SC value for an OFNS message shall be set to the SC value of the corresponding OFS message. I(RS_TS_20033, RS_TS_20035, RS_TS_20036)

7.4.6.5 CRC Calculation

[SWS_CanTSyn_00050][

The function $Crc_CalculateCRC8H2F()$ as defined in [5] shall be used to calculate the CRC if configured.

[(RS_TS_20033, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00054][

The DataID shall be calculated as DataID = DataIDList[SC], where DataIDList (ECUC_CanTSyn_00024 : ECUC_CanTSyn_00025 :

ECUC_CanTSyn_00026 : ECUC_CanTSyn_00041 :) is given by configuration for each message *Type*.

[(RS_TS_20033, RS_TS_20035, RS_TS_20036)

Note: A specific <code>DataID</code> out of a predefined <code>DataIDList</code> ensures the identification of data elements of Time Synchronization messages.

[SWS_CanTSyn_00055][

If CantSynUseExtendedMsgFormat is FALSE, the *CRC* shall be calculated over Time Synchronization message *Byte 2* to *Byte 7* and DataID, where Byte 2 is applied first, followed by the other bytes in ascending order, and DataID last.

If CantSynUseExtendedMsgFormat is TRUE, the CRC shall be calculated over Time Synchronization message Byte 2 to Byte 15 and DataID for Extended Timesync message formats, where Byte 2 is applied first, followed by the other bytes in ascending order, and DataID last.

I(RS_TS_20033, RS_TS_20035, RS_TS_20036, RS_TS_20068)

7.4.6.6 Message Assembling

[SWS CanTSvn 00056][

For each transmission of a Time Synchronization message the CanTSyn module shall assemble the message as follows:

- 1. Calculate OVS (FUP only)
- 2. Calculate SGW (FUP, OFNS and Extended OFS)
- 3. Calculate SC
- 4. Copy all data to the appropriate position within the related message
- 5. Calculate *CRC* (configuration dependent)

I(RS_TS_20033, RS_TS_20035, RS_TS_20036)

7.5 Acting as Time Slave

A Time Slave is an entity, which is the recipient for a certain Time Base within a certain segment of a communication network, being a consumer for this Time Base.

7.5.1 SYNC and FUP message processing

[SWS_CanTSyn_00057][

The CanTSyn shall only accept a SYNC message with *Type* equal to 0x20 and a correct *CRC* value if CanTSynRxCrcValidated is configured to CRC_VALIDATED. J(RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00058][

The CanTSyn shall only accept a SYNC message with *Type* equal to 0x10 if CanTSynRxCrcValidated is configured to CRC_NOT_VALIDATED. |(RS_TS_20035)

[SWS_CanTSyn_00059][

The CanTSyn shall only accept a SYNC message with Type equal to 0x10 or 0x20 if CanTSynRxCrcValidated is configured to CRC_IGNORED. J(RS_TS_20035)

[SWS_CanTSyn_00109][

The CanTSyn shall only accept a SYNC message with Type equal to 0×10 or a SYNC message with Type equal to 0×20 and a correct CRC value if CanTSynRxCrcValidated is configured to CRC_OPTIONAL.](RS_TS_20034, RS_TS_20035)

[SWS CanTSvn 00060][

The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and *Type* equal to 0x28 and a correct *CRC* value if CanTSynRxCrcValidated is configured to CRC_VALIDATED. J(RS_TS_20034, RS_TS_20035)

[SWS CanTSvn 00061][

The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and *Type* equal to 0x18 if CanTSynRxCrcValidated is configured to CRC_NOT_VALIDATED.](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00062][

The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and Type equal to 0x18 or 0x28 if CanTSynRxCrcValidated is configured to CRC_IGNORED. I(RS TS 20034, RS TS 20035)

[SWS_CanTSyn_00110][

The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and Type equal to 0×18 or a FUP message with an identical sequence counter to the value of the corresponding SYNC message and Type equal to 0×28 and a correct CRC value if

CantSynRxCrcValidated is configured to CRC_OPTIONAL.

(RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00063][

For each configured Time Slave (CantSynGlobalTimeSlave) the CantSyn module shall observe the *reception timeout*

CanTSynGlobalTimeFollowUpTimeout (ECUC_CanTSyn_00006:) between the SYNC and its FUP message. If the *reception timeout* occurs the sequence shall be reset (i.e., waiting for a new SYNC message). I(RS_TS_20034, RS_TS_20035)

Note: The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS CanTSyn 00064][

For a valid pair of SYNC and FUP messages a new Time Tuple, consisting of the Global Time value and the associated value of the Virtual Local Time, shall be calculated and forwarded to the StbM module via StbM_BusSetGlobalTime() (according to 9.2).

(RS_TS_20032, RS_TS_20034)

7.5.2 OFS and OFNS message processing

[SWS_CanTSyn_00065][

The CanTSyn shall only accept an OFS message with Type equal to 0x44 or 0x64 and a correct CRC value if CanTSynRxCrcValidated is configured to CRC VALIDATED.

I(RS_TS_20034, RS_TS_20036)

[SWS CanTSyn 00066][

The CanTSyn shall only accept an OFS message with Type equal to 0x34 or 0x54 if CanTSynRxCrcValidated is configured to CRC_NOT_VALIDATED. |(RS_TS_20036)

[SWS CanTSyn 00067][

The CanTSyn shall only accept an OFS message with Type equal to 0x34, 0x44, 0x54 or 0x64 if CanTSynRxCrcValidated is configured to CRC_IGNORED. |(RS_TS_20036)

[SWS_CanTSyn_00113][

The CanTSyn shall only accept an OFS message with Type equal to 0x34 or 0x54 or an OFS message with Type equal to 0x44 or 0x64 and a correct CRC value if CanTSynRxCrcValidated is configured to CRC_OPTIONAL. I(RS TS 20034, RS TS 20036)

[SWS_CanTSyn_00068][

The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x4C and a correct CRC value if CanTSynRxCrcValidated is configured to CRC VALIDATED.

(RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00069][

The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x3C if CanTSynRxCrcValidated is configured to CRC_NOT_VALIDATED. |(RS_TS_20036)

[SWS_CanTSyn_00070][

The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x3C or 0x4C if CanTSynRxCrcValidated is configured to CRC_IGNORED. |(RS_TS_20036)

[SWS CanTSyn 00114][

The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x3C or an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and Type equal to 0x4C and a correct CRC value if CanTSynRxCrcValidated is configured to CRC_OPTIONAL.](RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00071][

If CantSynUseExtendedMsgFormat is FALSE, the CantSyn shall observe for each configured Time Slave (CantSynGlobalTimeSlave) the reception timeout CantSynGlobalTimeFollowUpTimeout (ECUC_CantSyn_00006:) between the OFS and its OFNS message. If the reception timeout occurs the sequence shall be reset (i.e. waiting for a new OFS message).](RS_TS_20034, RS_TS_20036, RS_TS_20068)

Note: The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS_CanTSyn_00072][

For a valid pair of OFS and OFNS messages and if

CanTSynUseExtendedMsgFormat is FALSE, the CanTSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the

Virtual Local Time, (according to [SWS_CanTSyn_00074]) and forward it to the StbM module via StbM BusSetGlobalTime().

If CantSynUseExtendedMsgFormat is TRUE, the CantSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the Virtual Local Time, (according to [SWS_CantSyn_00074]) after receiving a valid OFS message and forward it to the StbM module via StbM_BusSetGlobalTime(). [(RS_TS_20032, RS_TS_20034, RS_TS_20068)

[SWS_CanTSyn_00116][

On an invocation of $StbM_BusSetGlobalTime()$ the parameter PathDelay of the measureDataPtr structure shall be set to 0. $J(RS_TS_20034)$

7.5.3 Validation and Disassembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be validated (1st step) and how the message will be disassembled (2nd step).

7.5.3.1 Global Time Calculation

[SWS_CanTSyn_00073][

The receiver of a Synchronized Time Base shall perform the following steps to retrieve the Synchronized Time Base exactly (refer to 9.2):

- 1. On SYNC message RX indication, which delivers Synchronized Time Base part T0:
 - a. Immediately establish a protection against interruptions and run the next step directly afterwards:
 - b. Retrieve the current Virtual Local Time value as $T2_{VLT}$ via $StbM_GetCurrentVirtualLocalTime()$
 - c. The protection against interruptions may be released
- 2. On FUP message reception (either in RX indication or in the subsequent MainFunction invocation), which delivers Synchronized Time Base part T4 = (OVS + SyncTimeNSec), retrieve current Virtual Local Time value as T5_{VLT} via StbM GetCurrentVirtualLocalTime()
- 3. Calculate the Time Tuple [T5; T5_{VLT}] to update the Time Slave's Local Time Base:

$$T5 = T0 + T4 + (T5VLT - T2VLT).$$

I(RS TS 20035)

Note: Immediately protecting against interruptions means that there shall be no frame checks before. If called in context of the Rx interrupt with interrupt nesting

disabled, this is typically implicitly ensured by the controller. Once the interrupts are locked, it is ok to check whether the received message is a SYNC message for which a snapshot of the Virtual Local Time shall be taken, but no other frame checks (e.g., CRC validation, SC validation, etc.) shall be done before taking the snapshot. Once the snapshot has been taken it is ok to remove the protection against interruptions and to make the necessary validations. This means that a snapshot of the Virtual Local Time shall be taken even if the succeeding validations fail and thus making the snapshot superfluous.

[SWS_CanTSyn_00074][

The receiver of an Offset Time Base shall perform the following steps to assemble the Offset Time:

- 1. Get second portion of the Offset Time out of OfsTimeSec
- 2. Get nanosecond portion of the Offset Time out of OfsTimeNSec
- 3. Retrieve current Virtual Local Time value via StbM_GetCurrentVirtualLocalTime()

(RS_TS_20036)

Note: OFS and OFNS messages are not time stamped.

7.5.3.2 OVS Consideration

[SWS_CanTSyn_00075][

OVS (FUP only) shall be considered on the receiver side to retrieve the second portion of the received Synchronized Time Base. I(RS_TS_20035)

7.5.3.3 SGW Calculation

[SWS_CanTSyn_00133][

If the SGW value (FUP, OFNS and Extended OFS) is set to SyncToSubDomain, the SYNC_TO_GATEWAY bit within timeBaseStatus shall be set to TRUE. Otherwise, it shall be set to FALSE.

I(RS TS 20032, RS TS 20034)

7.5.3.4 Sequence Counter Validation

[SWS CanTSvn 00076][

The Sequence Counter of each SYNC message must match to the Sequence Counter of the next incoming FUP message of the same Time Domain. Otherwise, the contents of the already received SYNC message shall be discarded and the received FUP message shall be ignored.

(RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00077][

If CantSynUseExtendedMsgFormat is FALSE, the Sequence Counter of each OFS message must match to the Sequence Counter of the next incoming OFNS message of the same Time Domain. If the SCs do not match, the received OFNS message

shall be ignored and the contents of the already received OFS message shall be discarded.

I(RS_TS_20034, RS_TS_20036, RS_TS_20068)

[SWS_CanTSyn_00078][

The Sequence Counter Jump Width between two consecutive SYNC or two consecutive OFS messages of the same Time Domain shall be greater than 0 and smaller than or equal to CantSynGlobalTimeSequenceCounterJumpWidth. Otherwise, a Time Slave shall ignore the respective SYNC / OFS message. The CantSynGlobalTimeSequenceCounterJumpWidth value 0 is not allowed. J(RS_TS_20034, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00079][

Upon reception of a SYNC (or OFS) message a Time Slave shall check the Sequence Counter of the received message per Time Domain against the configured value of CantSynGlobalTimeSequenceCounterJumpWidth (according to [SWS_CantSyn_00078]), unless it is the first message

- at Startup or
- after a Time Base update timeout has been detected (TIMEOUT bit set in Time Base synchronization status timeBaseStatus).

I(RS_TS_20034, RS_TS_20035, RS_TS_20036)

Note: There are scenarios when it makes sense to skip the check of the Sequence Counter Jump Width, e.g. at startup (Time Slaves start asynchronously to the Time Master) or after a message timeout to allow for Sequence Counter (re-)synchronization. In case of a timeout the error has been detected already by the timeout monitoring, there is no benefit in generating a subsequent error by the jump width check.

Note: According to **[SWS_CanTSyn_00078]** the Sequence Counter validation will still discard messages with a Sequence Counter Jump Width being zero (i.e., stuck Sequence Counter) during Time Base update timeout.

7.5.3.5 CRC Validation

[SWS_CanTSyn_00080][

The function $Crc_CalculateCRC8H2F()$ as defined in [5] shall be used to validate the CRC if configured.

I(RS_TS_20034, RS_TS_20035, RS_TS_20036)

[SWS CanTSyn 00084][

The DataID shall be calculated as DataID = DataIDList[SC], where DataIDList is given by configuration for each message Type.](RS_TS_20034, RS_TS_20035)

Note: A specific <code>DataID</code> out of a predefined <code>DataIDList</code> ensures the identification of data elements of time synchronization messages.

[SWS_CanTSyn_00085][

If CantSynUseExtendedMsgFormat is FALSE, the *CRC* shall be calculated over Time Synchronization message *Byte 2* to *Byte 7* and DataID, where Byte 2 is applied first, followed by the other Bytes in ascending order, and DataID last.

If CantSynUseExtendedMsgFormat is TRUE, the *CRC* shall be calculated over Time Synchronization message *Byte 2* to *Byte 15* and DataID for Extended Timesync message formats, where Byte 2 is applied first, followed by the other bytes in ascending order, and DataID last.

J(RS_TS_20034, RS_TS_20035, RS_TS_20036, RS_TS_20068)

7.5.3.6 Message Disassembling

[SWS_CanTSyn_00086][

For each received Time Synchronization message the CanTSyn shall validate the message as follows (all conditions must match):

- 1. Type matches depending on the CantSynRxCrcValidated parameter
- 2. SC value is within the accepted range (refer to [SWS_CanTSyn_00078] and [SWS_CanTSyn_00079])
- 3. D matches to the defined Time Domain range for each Type
- 4. *D* matches to one of the configured Time Domains (given by parameter CanTSynGlobalTimeDomainId)
- 5. SyncTimeNSec (FUP / OFNS / Extended OFS only) matches the defined range of StbM TimeStampType.nanoseconds.
- 6. CRC (including DataID) matches depending on the CanTSynRxCrcValidated parameter

I(RS_TS_20035, RS_TS_20036)

[SWS CanTSvn 00087][

For each received Time Synchronization message the CanTSyn shall disassemble the message after successful validation (refer to **[SWS_CanTSyn_00086]**). |(RS_TS_20034, RS_TS_20035, RS_TS_20036)

7.6 Time Recording

7.6.1 Global Time Precision Measurement

[SWS_CanTSyn_00115][

On an invocation of $StbM_BusSetGlobalTime()$ the parameter PathDelay of the measureDataPtr structure shall be set to 0. I(RS TS 20034)

7.6.2 Time Validation

[SWS_CanTSyn_00137]

The CanTSyn shall support Time Validation, if CanTSynTimeValidationSupport (ECUC_CanTSyn_00050) set to TRUE.

(RS_TS_00034)

[SWS_CanTSyn_00138]

lf

- CanTSynTimeValidationSupport is enabled and
- CantSynEnableTimeValidation for the Time Domain is enabled

CanTSyn shall do time recording for Time Validation for that Time Domain

(RS_TS_00034)

[SWS_CanTSyn_00139]

lf

- time recording for Time Validation is enabled for a Time Domain (refer to [SWS_CanTSyn_00115] and [SWS_CanTSyn_00116]) and
- CanTSyn is configured as Time Slave for that Time Domain,

CanTSyn shall call StbM_CanSetSlaveTimingData() upon successful reception of a FUP message (refer to Figure 5).

```
StbM_CanSetSlaveTimingData() shall be called after StbM_BusSetGlobalTime().

J(RS_TS_00034)
```

Note: StbM_BusSetGlobalTime() shall be called first, because it updates the Synclocal Time Tuple (refer to [4]), which is required by StbM CanSetSlaveTimingData().

[SWS_CanTSyn_00140]

Upon invocation of StbM_CanSetSlaveTimingData()
CanTSyn shall pass following values

- the sequence counter value from the transmitter (Time Master),
- the segment id of the physical channel on which the Sync message has been received (refer to parameter CanTSynGlobalTimeNetworkSegmentId (ECUC_CanTSyn_00052:))
- T2_{VLT} as syncIngressTimestamp for the SYNC Message (refer to step 1 in [SWS_CanTSyn_00073]),
- T0 + T4 as preciseOriginTimestamp received from the Time Master (refer to [SWS_CanTSyn_00073])

to the function by the parameter measureDataPtr.

Struct members

- measureDataPtr->referenceLocalTimestamp and
- measureDataPtr->refrenceGlobalTimestamp

shall be passed as 0.

(RS_TS_00034)

Note: The CanTSyn passes 0 to avoid undefined values. The structure members referenceLocalTimestamp and referenceGlobalTimestamp will be set by the StbM StbM_CanSetSlaveTimingData() internally (refer to SWS_StbM_00471 in [4]).

[SWS CanTSyn 00141]

lf

- time recording for Time Validation is enabled for a Time Domain (refer to [SWS_CanTSyn_00115] and [SWS_CanTSyn_00116]) and
- CanTSyn is configured as Time Master for that Time Domain

CanTSyn shall call StbM_CanSetMasterValidationData() upon successful transmission of a SYNC message message (refer to Figure 4).

∫(RS_TS_00034)

[SWS_CanTSyn_00142][

Upon invocation of StbM_CanSetMasterValidationData() CanTSyn shall pass the following data

- the sequence counter as sent in the Sync message
- the segment id of the physical channel on which the Sync message has been sent (refer to parameter CanTSynGlobalTimeNetworkSegmentId (ECUC_CanTSyn_00052:))
- T1vlt as the syncEgressTimestamp of SYNC Message (refer to step 2 in [SWS_CanTSyn_00045]),
- T0_{SYN} + (T1_{VLT} T0_{VLT}) as preciseOriginTimestamp (refer to [SWS_CanTSyn_00045]),

to the function by the parameter measureDataPtr.

J(RS_TS_00034)

7.7 Error Classification

Section 7.2 "Error Handling" of the document "General Specification of Basic Software Modules" [8] describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.7.1 Development Errors

[SWS_CanTSyn_00089][

[5176_54176J11_55555]				
Type of error	Related error code	Error value		
API service called with wrong PDU or SDU	CANTSYN_E_INVALID_PDUID	0x01		
API service used in un-initialized state	CANTSYN_E_UNINIT	0x02		
A pointer is NULL	CANTSYN_E_NULL_POINTER	0x03		
CanTSyn initialization failed	CANTSYN_E_INIT_FAILED	0x04		
API called with invalid parameter	CANTSYN_E_PARAM	0x05		
Invalid Controller index	CANTSYN_E_INV_CTRL_IDX	0x06		

(SRS_BSW_00385)

7.7.2 Runtime Errors

There are no runtime errors.

7.7.3 Transient Faults

There are no transient faults.

7.7.4 Production Errors

There are no production errors.

7.7.5 Extended Production Errors

There are no extended production errors.

8 API specification

8.1 API

8.1.1 Imported types

In this section all types included from the following files are listed:

[SWS_CanTSyn_00090][

Module	Header File	Imported Type
	ComStack_Types.h	PduldType
ComStack_Types	ComStack_Types.h	PduInfoType
	ComStack_Types.h	PduLengthType
	Rte_StbM_Type.h	StbM_CanTimeMasterMeasurementType
	Rte_StbM_Type.h	StbM_CanTimeSlaveMeasurementType
	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType
StbM	Rte_StbM_Type.h	StbM_TimeBaseStatusType
	Rte_StbM_Type.h	StbM_TimeStampShortType
	Rte_StbM_Type.h	StbM_TimeStampType
	Rte_StbM_Type.h	StbM_UserDataType
	StbM.h	StbM_MeasurementType
	StbM.h	StbM_VirtualLocalTimeType
0.1	Std_Types.h	Std_ReturnType
Std	Std_Types.h	Std_VersionInfoType

J(RS_TS_20035)

8.1.2 Type definitions

8.1.2.1 CanTSyn_ConfigType

[SWS_CanTSyn_00091][

Name	CanTSyn_ConfigType
Kind	Structure

	implementation specific	
Elements	Туре	
	Comment	
Description	This is the base type for the configuration of the Time Synchronization over CAN. A pointer to an instance of this structure will be used in the initialization of the Time Synchronization over CAN. The content of this structure is defined in chapter 10 Configuration specification.	
Available via	CanTSyn.h	

J(RS_TS_20035)

8.1.2.2 CanTSyn_TransmissionModeType

[SWS_CanTSyn_00092][

[6116_64116711_00062]			
Name	CanTSyn_TransmissionModeType		
Kind	Enumeration		
Pommo	CANTSYN_TX_OFF		Transmission Disabled
Range	CANTSYN_TX_ON		Transmission Enabled
Description	Handles the enabling and disabling of the transmission mode		
Available via	CanTSyn.h		

J(RS_TS_20035)

8.1.3 Function definitions

8.1.3.1 CanTSyn_Init

[SWS_CanTSyn_00093][

Service Name	CanTSyn_Init	
Syntax	<pre>void CanTSyn_Init (const CanTSyn_ConfigType* configPtr)</pre>	
Service ID [hex]	0x01	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	configPtr Pointer to selected configuration structure	
Parameters (inout)	None	

Parameters (out)	None
Return value	None
Description	This function initializes the Time Synchronization over CAN.
Available via	CanTSyn.h

J(RS_TS_20035)

CANTSYN_E_INIT_FAILED is reported as specified in [reference to SWS BSW General] by SWS_BSW_00050.

See section 7.2.1 for details.

8.1.3.2 CanTSyn_GetVersionInfo

[SWS_CanTSyn_00094][

[5W5_Cairr5yii_00094]			
Service Name	CanTSyn_GetVersionInfo		
Syntax	<pre>void CanTSyn_GetVersionInfo (Std_VersionInfoType* versioninfo)</pre>		
Service ID [hex]	0x02	0x02	
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	versioninfo Pointer to where to store the version information of this module.		
Return value	None		
Description	Returns the version information of this module.		
Available via	CanTSyn.h		

J(RS_TS_20035)

8.1.3.3 CanTSyn_SetTransmissionMode

[SWS_CanTSyn_00095][

- 11 - 1 - 1 - 1 - 1 - 1 - 1 - 1 - 1 -		
Service Name	CanTSyn_SetTransmissionMode	
Syntax	<pre>void CanTSyn_SetTransmissionMode (uint8 CtrlIdx, CanTSyn_TransmissionModeType Mode)</pre>	

Service ID [hex]	0x03	0x03	
Sync/Async	Synchronou	Synchronous	
Reentrancy	Non Reentr	Non Reentrant	
Bayamataya (in)	Ctrlldx	Ctrlldx Index of the CAN channel	
Parameters (in)	Mode CANTSYN_TX_OFF CANTSYN_TX_ON		
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	This API is used to turn on and off the TX capabilities of the CanTSyn.		
Available via	CanTSyn.h	CanTSyn.h	

J(RS_TS_20035)

[SWS_CanTSyn_00134][

The function CantSyn_SetTransmissionMode() shall inform the DET, if development error detection is enabled (CantSynDevErrorDetect is set to TRUE) and if function call has failed because of the following reasons:

- Invalid Ctrlidx (CANTSYN E INV CTRL IDX)
- Invalid Mode (CANTSYN E PARAM)

I(SRS_BSW_00323, SRS_BSW_00337)

8.1.4 Call-back notifications

This is a list of functions provided for other modules.

8.1.4.1 CanTSyn_RxIndication

[SWS_CanTSyn_00096][

Service Name	CanTSyn_RxIndication		
Syntax	<pre>void CanTSyn_RxIndication (PduIdType RxPduId, const PduInfoType* PduInfoPtr)</pre>		
Service ID [hex]	0x42		
Sync/Async	Synchronous		
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.		
Parameters (in)	RxPdu ID of the received PDU.		

	Pdu InfoPtr	Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.	
Parameters (inout)	None		
Parameters (out)	None	None	
Return value	None		
Description	Indication of a received PDU from a lower layer communication interface module.		
Available via	CanTSyn.h		

(RS_TS_20035)

Note: The callback function <code>CanTSyn_RxIndication()</code> called by the CAN Interface and implemented by the CanTSyn module. It is called in case of a receive indication event of the CAN Driver.

[SWS_CanTSyn_00097][

The callback function <code>CanTSyn_RxIndication()</code> shall inform the DET, if development error detection is enabled (<code>CanTSynDevErrorDetect</code> is set to <code>TRUE</code>) and if function call has failed because of the following reasons:

- Invalid PDU ID (CANTSYN_E_INVALID_PDUID)
- PduInfoPtr or SduDataPtr equals NULL_PTR (CANTSYN E NULL POINTER)

I(SRS_BSW_00323, SRS_BSW_00337)

Caveats of CanTSyn RxIndication():

Until this service returns, the CAN Interface will not access canSduPtr. The canSduPtr is only valid and can be used by upper layers until the indication returns. The CAN Interface guarantees that the number of configured bytes for this CanTSynRxPduId is valid. The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.

Note: Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.

The CanTSyn module is initialized correctly.

8.1.4.2 CanTSyn_TxConfirmation

[SWS CanTSvn 000991]

<u> </u>			
Service Name	CanTSyn_TxConfirmation		
Syntax	<pre>void CanTSyn_TxConfirmation (PduIdType TxPduId, Std_ReturnType result</pre>		

)				
Service ID [hex]	0x40				
Sync/Async	Synchrono	ous			
Reentrancy	Reentrant	for different Pdulds. Non reentrant for the same Pduld.			
	TxPduld	ID of the PDU that has been transmitted.			
Parameters (in)	result	result E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.			
Parameters (inout)	None				
Parameters (out)	None				
Return value	None				
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.				
Available via	CanTSyn.	CanTSyn.h			

(RS_TS_20035)

Note: The callback function $CanTSyn_TxConfirmation()$ is called by the CAN Interface and implemented by the CanTSyn module.

[SWS_CanTSyn_00100][

The callback function <code>CanTSyn_TxConfirmation()</code> shall inform the DET, if development error detection is enabled (<code>CanTSynDevErrorDetect</code> is set to <code>TRUE</code>) and if the function call has failed because of the following reason:

• Invalid PDU ID (CANTSYN_E_INVALID_PDUID), i.e., a PDU ID not configured by parameter CanTSynGlobalTimeMasterConfirmationHandleId I(SRS_BSW_00323, SRS_BSW_00337)

Caveats of CanTSyn TxConfirmation():

- The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.
 - **Note:** Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.
- The CanTSyn module is initialized correctly.

8.1.5 Scheduled functions

These functions are directly called by the Basic Software Scheduler. The following functions shall have no return value and no parameters. All functions shall be non-reentrant.

8.1.5.1 CanTSyn_MainFunction

[SWS_CanTSyn_00102][

<u>terre_earreyn_</u>	
Service Name	CanTSyn_MainFunction
Syntax	<pre>void CanTSyn_MainFunction (void)</pre>
Service ID [hex]	0x06
Description	Main function for cyclic call / resp. Timesync message transmission
Available via	CanTSyn_SchM.h

J(RS_TS_20035)

[SWS_CanTSyn_00103][

The frequency of invocations of CantSyn_MainFunction() is determined by the configuration parameter CantSynMainFunctionPeriod (refer to ECUC_CantSyn_00019:).

J(RS_TS_20035)

8.1.6 Expected Interfaces

In this section, all interfaces required by other modules are listed.

8.1.6.1 Mandatory Interfaces

This section defines all interfaces that are required to fulfill a mandatory functionality of the module.

[SWS_CanTSyn_00105][

API Function	Header File	Description
StbM_GetCurrentVirtualLocal- Time	StbM.h	Returns the Virtual Local Time of the referenced Time Base.

(RS_TS_20035)

8.1.6.2 Optional Interfaces

This section defines all interfaces that are required to fulfill an optional functionality of the module.

[SWS_CanTSyn_00106][

LOWO_Gailloy			
API Function	Header File	Description	
CanIf_Transmit	Canlf.h	Requests transmission of a PDU.	
Crc_CalculateC- RC8H2F	Crc.h	This service makes a CRC8 calculation with the Polynomial 0x2F on Crc_Length	
Det_ReportError	Det.h	Service to report development errors.	
StbM_BusGet- CurrentTime	StbM.h	Returns the current Time Tuple, status and User Data of the Time Base.	
StbM_BusSet- GlobalTime	StbM.h	Allows the Time Base Provider Modules to forward a new Global Time tuple (i.e., the Received Time Tuple) to the StbM.	
StbM_CanSet- MasterTiming- Data	StbM_ Can TSyn.h	Provides CAN Timesyn module specific data for a Time Master to the StbM. Tags:atp.Status=draft	
StbM_CanSet- SlaveTimingData	StbM_ Can TSyn.h	Allows the CanTSyn Module to forward CAN specific details to the StbM. Tags:atp.Status=draft	
StbM_Get- CurrentTime	StbM.h	Returns a time value (Local Time Base derived from Global Time Base) in standard format. Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).	
StbM_GetOffset	StbM.h	Allows the Timesync Modules to get the current Offset Time and	

		User Data.	
StbM_GetTime- BaseStatus	StbM.h	Returns detailed status information for a Synchronized (or Pure Local) Time Base and, if called for an Offset Time Base, for the Offset Time Base and the underlying Synchronized Time Base.	
StbM_GetTime- BaseUpdate- Counter	StbM.h	Allows the Timesync Modules to detect, whether a Time Base sho be transmitted immediately in the subsequent <bus>TSyn_Main Function() cycle.</bus>

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification section 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave section 10.1 in the specification to guarantee comprehension.

Section 10.2 specifies the structure (containers) and the parameters of the Time Synchronization over CAN.

Section 10.2.16 specifies published information of the Time Synchronization over CAN.

10.1 How to read this chapter

For details, refer to the chapter 10.1 "Introduction to configuration specification" in SWS_BSWGeneral.

10.2 Containers and configuration parameters

The following sections summarize all configuration parameters of the Time Synchronization over CAN. The detailed meaning of the parameters is described in chapters 7 and 8.

10.2.1 Variants

[SWS_CanTSyn_00108][

The Time Synchronization over CAN shall support the configuration for Time Master, Time Slave and Time Gateway. [(RS_TS_20038)

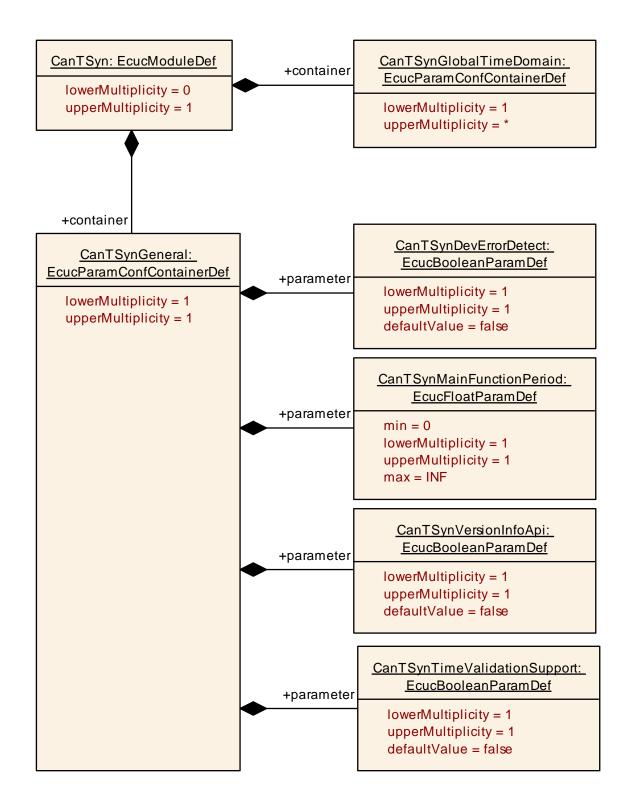

The module supports different post-build variants (previously known as post-build selectable configuration sets), but not post-build loadable configuration.

10.2.2 CanTSyn

SWS Item	ECUC_CanTSyn_00001:			
Module Name	CanTSyn			
	Configuration of the Synchronized Time-base Manager (StbM) module with respect to global time handling on CAN.			
Post-Build Variant Support	true			
Supported Config Variants	VARIANT-PRE-COMPILE			

ncluded Containers				
Container Name	Multiplicity	Scope / Dependency		
		This container holds the general parameters of the CAN- specific Synchronized Time-base Manager		
CanTSynGlobalTimeDomain	1*	This represents the existence of a global time domain on CAN. The CanTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the CanTSyn exists it is assumed that at least one global time domain exists.		

10.2.3 CanTSynGeneral

SWS Item	ECUC_CanTSyn_00003:
Container Name	CanTSynGeneral
Parent Container	CanTSyn
Description	This container holds the general parameters of the CAN-specific

	Synchronized Time-base Manager
Configuration Parameters

Range	1 15		
Default value			
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time		
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	ECUC_CanTSyn_00021:
Name	CanTSynRxCrcValidated
Parent Container	CanTSynGlobalTimeSlave
Description	Definition of whether or not validation of the CRC is supported.
Multiplicity	1
Туре	EcucEnumerationParamDef

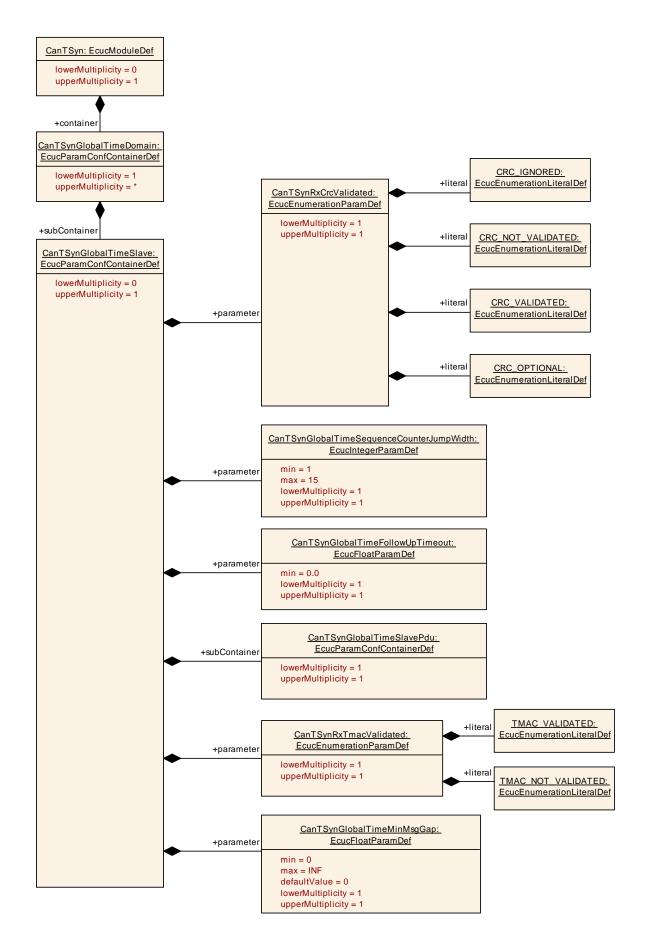

Range	CRC_IGNORED	The Timesync module accepts Time Synchronization messages, which are CRC secured (without actually validating the CRC) and those, which are not CRC secured. That means, the Timesync module ignores the CRC.
	CRC_NOT_VALIDATED	The Timesync module accepts only Time Synchronization messages, which are not CRC secured. All other Time Synchronization messages are ignored.
	CRC_OPTIONAL	The Timesync module accepts only Time Synchronization messages which are not CRC secured and Time Synchronization messages which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.
	CRC_VALIDATED	The Timesync module accepts only Time Synchronization messages, which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.
Post-Build Variant Value	true	
Value	Pre-compile time	X All Variants
Configuration	Link time	
Class	Post-build time	
Scope / Dependency	scope: local	

SWS Item	ECUC_CanTSyn_00048:		
Name	CanTSynRxTmacValidated		
Parent Container	CanTSynGlobalTimeSlave		
Description	This parameter controls whether or not TI	ИАС	validation shall be supported.
	Tags:		
	atp.Status=draft		
Multiplicity	1		
Туре	EcucEnumerationParamDef		
Range	TMAC_NOT_VALIDATED		e Timesync module shall not validate TMAC.
	TMAC_VALIDATED		e Timesync module shall validate the AC.
Post-Build Variant Value	true		
Value	Pre-compile time	X	All Variants
Configuration	Link time		
Class	Post-build time		
Scope /	scope: local		
Dependency			

Included Containers		
Container Name	Multiplicity	Scope / Dependency
CanTSynGlobalTimeSlavePd u	1	This container encloses the configuration of the PDU that is supposed to contain the global time information.

10.2.16 CanTSynGlobalTimeSlavePdu

SWS Item	ECUC_CanTSyn_00014:
Container Name	CanTSynGlobalTimeSlavePdu
Parent Container	CanTSynGlobalTimeSlave
Description	This container encloses the configuration of the PDU that is supposed to contain the global time information.
Configuration Parameters	

SWS Item	ECUC_CanTSyn_00013:			
Name	CanTSynGlobalTimeSlaveHandleId			
Parent Container	CanTSynGlobalTimeSlavePdu			
Description	This represents the handle ID of the PDU that contains the global time information.			
Multiplicity	1			
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)			
Range	0 65535			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_CanTSyn_00040:			
Name	CanTSynGlobalTimePduRef			
Parent Container	CanTSynGlobalTimeSlavePdu			
Description	This represents the reference to the Pdu taken to transmit the global time information. The global time master of a global time domain acts as the sender of the Pdu while all the time slaves are supposed to receive the Pdu.			
Multiplicity	1			
Туре	Reference to [Pdu]			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

No Included Containers
